

ACCOUNTS

OOP Exercise.

Create a class called Account in PHP, with, at least, the following methods:

- deposit(): To increase the balance with a quantity set as a parameter.
- withdraw(): To decrease the balance with a quantity set as a parameter.
- transfer(): To move some quantity to another account.
- get_balance(): To get the balance of the account.

Obviously, you will need some compulsory properties, to save data related to the owner and the account, but the rest of the arguments will be up to you.

You can also create some additional classes (¿Customer?) if you feel the need to.

The user interface will be on your own, but it must allow to do all the operations described before.

In this exercise, you will create several accounts, transfer some money and check the balances.
